

## Brainstorming & Idea Prioritization Template

|                      |                                                                 |
|----------------------|-----------------------------------------------------------------|
| <b>Date</b>          | 3 July 2026                                                     |
| <b>Team ID</b>       |                                                                 |
| <b>Project Name</b>  | Rising Waters – A Machine Learning Approach to Flood Prediction |
| <b>Maximum Marks</b> | 3 Marks                                                         |

### Step 1: Brainstorm and Idea Listing

Each team member lists out as many ideas as possible without judging them at this stage.

| S.No | Team Member                | Idea / Suggestion                                                                                                            | Category        | Group No. |
|------|----------------------------|------------------------------------------------------------------------------------------------------------------------------|-----------------|-----------|
| 1    | Lakshmi Lathish Pasupuleti | Use a machine learning classification model to predict whether a flood will occur based on rainfall and weather data         | Model Building  | 1         |
| 2    | Lokasree Ranga Priya Duddu | Build an interactive Flask web application so users can enter local weather readings and get a realtime flood risk result    | Web Application | 2         |
| 3    | Lakshmi Lathish Pasupuleti | Collect and clean historical rainfall data (India, 1901–2015) and a flood occurrence dataset to train the model on           | Data Collection | 1         |
| 4    | Lokasree Ranga Priya Duddu | Design a simple, grouped input form (Atmospheric Readings, Seasonal Rainfall, Derived Indicators) so the tool is easy to use | UI / UX Design  | 2         |
| 5    | Lakshmi Lathish Pasupuleti | Train and compare multiple algorithms (Logistic Regression, Random Forest, etc.) and select the model with the best accuracy | Model Building  | 1         |
| 6    | Lokasree Ranga Priya Duddu | Package the trained model with the web app using Docker and deploy it to a cloud platform for public access                  | Deployment      | 3         |

### Step 2: Idea Prioritization

Rate each grouped idea on feasibility and importance, then select the final idea(s) to move forward with.

| Group No. | Final Idea                                                                               | Feasibility (High/Medium/Low) | Importance (High/Medium/Low) | Priority | Selected (Yes/No) |
|-----------|------------------------------------------------------------------------------------------|-------------------------------|------------------------------|----------|-------------------|
| 1         | Train an ML model on rainfall and atmospheric data to classify flood risk                | High                          | High                         | High     | Yes               |
| 2         | Develop a Flask-based web interface for entering readings and viewing prediction results | High                          | High                         | High     | Yes               |

|   |                                                                 |        |      |        |     |
|---|-----------------------------------------------------------------|--------|------|--------|-----|
| 3 | Containerize and deploy the app with Docker on a cloud platform | Medium | High | Medium | Yes |
|---|-----------------------------------------------------------------|--------|------|--------|-----|
