Project Name	Rising Waters - ML-Based Flood Prediction System
Maximum Marks	2 Marks

Customer Journey Map

Map of a resident/official's experience using Rising Waters, from noticing heavy rainfall through checking flood risk to acting on the prediction, with ownership and improvement opportunities at each stage.

Phase of Journey	Stage 1	Stage 2	Stage 3
Actions <i>What does the customer do?</i>	- Monitors weather updates during heavy monsoon rain - Notices unusually high rainfall/humidity readings - Becomes concerned about possible flooding	- Opens the Rising Waters web app - Enters current temperature, humidity, cloud cover and rainfall figures - Submits the form to get a prediction	- Reviews the flood/no-flood result and probability - Decides whether to prepare, evacuate, or continue as normal - Shares the warning with family or local community if needed
Touchpoint <i>What part of the service do they interact with?</i>	- TV/radio weather bulletins - Mobile weather apps - Community/official rain alerts	- Rising Waters home page - Prediction input form (predict.html) - Flask backend + XGBoost model	- Flood result page (flood_result.html) - No-flood result page (no_flood_result.html) - Local disaster-management advisories
Customer Thought <i>What is the customer thinking?</i>	"Is this rain going to cause a flood near me?" "I need a quick, reliable way to check." "I don't want to rely on guesswork."	"I hope this form is quick and easy to fill." "Will this prediction actually be accurate?" "Let's see what the model says."	"Now I know what to do next." "I should act early rather than wait." "This gave me a clear, data-backed answer."

Customer Feeling <i>What is the customer feeling?</i>	• Anxious • Uncertain • On edge	• Hopeful • Focused • A little impatient	• Reassured • Prepared • In control
Process Ownership <i>Who is in the lead on this?</i>	• Local meteorological department • District disaster-management team	• Rising Waters development/ML team maintaining the app and model	• District disaster-management team • End user (resident/official) acting on the result
Opportunities <i>How can we improve this stage?</i>	• Push proactive alerts before the user has to search • Integrate live weather-feed notifications	• Auto-fetch weather data via an API instead of manual entry • Simplify the input form further • Add a mobile-friendly version	• Add clear, actionable next-step recommendations • Integrate SMS/WhatsApp alerts for offline reach • Log outcomes to keep improving model accuracy
